Step 2: Try a Plunger

A plunger is a simple tool that can be used to unclog sinks and toilets. To use a plunger, follow these steps:

1. Fill the sink with enough water to cover the plunger cup.
2. Place the plunger over the drain and push and pull vigorously.
3. Repeat until the clog is cleared.

Step 3: Use a Drain Snake

If a plunger doesn't work, you can try using a drain snake. A drain snake is a thin, flexible cable that can be inserted into the drain to break up clogs. To use a drain snake, follow these steps:

1. Insert the drain snake into the drain and push it down until it reaches the clog.
2. Turn the crank on the drain snake to rotate the cable and break up the clog.
3. Pull the drain snake out of the drain and rinse it with water.

Step 4: Use a Chemical Drain Cleaner

If a plunger and drain snake don't work, you can try using a chemical drain cleaner. Chemical drain cleaners are powerful chemicals that can dissolve clogs. To use a chemical drain cleaner, follow the instructions on the product label.

Step 5: Call a Plumber

If you've tried all of the above methods and your sink is still clogged, you may need to call a plumber. A plumber can use specialized tools and techniques to clear even the most stubborn clogs.

Preventing Clogged Sinks

There are a few things you can do to prevent clogged sinks, including:

- Don't pour grease or oil down the drain.
